Submicroscopic Structure of the Inner Ear Salvatore Iurato

Submicroscopic Structure of the Inner Ear focuses on the submicroscopic structure of the inner ear of mammals, as investigated in guinea pigs, cats, chinchillas, squirrel-monkeys, and rats.

This book consists of experimental investigations, such as the efferent innervation of the organ of Corti; ototoxicity of some antibiotics; acoustic trauma; and circulation of the labyrinthine fluids. Investigations on the human labyrinth, normal and affected by Meniere's disease, are also covered. This text likewise describes the combined electron-microscopic and electrophysiological research studies that provide a basis for a correlation of the submicroscopic structure and function of the sensory cells. A review of the main light-microscopic features is included for those who are not familiar with the morphology of the inner ear.

This publication is intended for students or individuals working on the morphology of the ear, but is also a good reference for anatomists, otologists, zoologists, psychologists, and neurophysiologists interested in the structure of the inner ear.
